A Statement of the Colombian Constitutional Court has mandated wage indexation on the basis of past inflation. A simple model with a wage price system, a real block, and an inflation targeting interest rule is calibrated to resemble price setting in the Colombian economy and to analize the differing slope of the output inflation trade oo for different specifications of wage indexation. The disinflation experiments the effect of monetary policy, and increases the cost of disinflation. Shorter wage contracts and more frequent wage negotiations do not appear to have important effects on the cost of disinflation. Higher central bank credibility and the use of forward looking inflation expectations in wage negotiations decrease the cost of disinflation and may eventually lead to a boom.
